ENERGY SAVING

eco line

Energy saving is the goal, while the rational use of energy (and therefore the application of efficient technologies) is the means to reduce the consumption of resources, thus lowering production costs. With this concept in mind we developed a new line where the implementation of the most efficient technologies allows to combine high perfomances with a remarkably lower energy consumption if compared to standard lines (a proven saving of far more than 20%).

Infrared heating

Gearless torque motors

The use of **infrared technology** for thermoregulation of extruders, as well as the application of **torque motors**, besides all the gearless synchronous motors, improves the lines performances, with an excellent **reduction in consumptions** and a consequent best **cost/production** ratio.
